                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 2, A Sequence 2, A Sequence 2, A Sequence 2, A Sequence 3, A Se

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Disclosure; SEQ ID NO 69; 164pp; French.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or rear diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (IGFR) and/or epidermal growth factor receptor (IGFR) and/or epidermal growth factor receptor (IGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of

ö
these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; brasst tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipeoriatic; psoriasis; dermatological disease; immune disorder; immunoglobulin; heavy chain variable region.

Interpretation traders to a novel resoluted anti-insulinities growing to appale of the property (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of capable of binding tromaine kinase activity of the receptor.

C comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acida (ADZ67016). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a cartivation of the IGF-IR and/or EGFR, and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induced a connected with inhibition of the insulin creeptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent and/or EGF-dependent and/or a medicament intended for the specific targeting of a biologically active compound to a medicament intended for the specific
invention relates to a novel isolated anti-insulin-like growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of IGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or epidermal growth factor receptor (IGFR) and/or with these receptors with their ligands. Especially they inhibit transformation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis, ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein sequence used to generate the Ab of the invention

```
The invertion relates to a novel isolated anti-insulinities growin factor of the invertion relates to a novel isolated anti-insulinities being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67001). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a cativation of the IGF-IR and/or EGFR, and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent and/or EGF-dependent cells, preferably IGF-dependent, cells connects of the cancer, of medicament intended for prevention or for the preparation of a medicament intended for prevention or for the preparation of a medicament intended for the specially get a biologically active compound to intended for the special for inversesing the IGF-IR and/or EGFR receptor. (I) is useful for inversesing or overexpressing of a biologically active compound or an underexpressing of a biologically act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (1), which is optionally labeled. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated anti-insulin-like growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Leger O, Duflos A, Haeuw J,

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (1) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or receptor (IGFR) and/or with of Signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit around transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and slow abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyroshine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a madicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal hyperactivation of the IGF-IR and/or connected with a hyperactivation of the IR-IR and/or septiment mediated by the interaction of IGF1 or IGF2 with IGF-IR and/or of EGF with EGFR, where

The present sequence is the heavy chain variable region of the anti-human Fas ligand monoclonal antibody (MAb) NOK-4. NOK-4 is produced by the hybridoma NOK-4 (FERM BP-5047), which was prepared by immunising mice with transformed human Ras ligand expressing COS cells, and fushing spleen cells isolated from the mice with myeloma P3x63Ag8.653 (ATCC CR1-1580) cells. The MAb recognises the human Fas ligand on the cell surface or in solution, and can be used to inhibit the apoptosis inducing cell surface Fas ligand/Fas reaction. The MAb can also be used for a Fas ligand assay in biological samples (e.g. human blood), especially for disease diagnosis, e.g. hepatitis, infectious mononucleosis and systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti-human Fas Ligand antibody to treat hepatitis – controls apoptosis in

                                                                                                                                                              ä
binding of FaeL to Fae expressing liver cells, and improves liver the function by improving blood glutamate oxaloacetate and pyruvate transaminase levels. The composition is given in a dosage of 0.0001-1000, preferably 0.01-600 mg/day. Spleen cells from mice immunised with FaeL expressing COS cells were fused with mouse myeloma cells to produce hybridomas. The hybridomas were screened for anti-FaeL activity, and the active clones NOKL-S isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for preparing variable region genes of high affinity tumor necrosis factor (TMF) resistant monoclonal antibody (F6 mAb). The method comprises using recombinant human TMF immune BALB/c mouse to prepare mouse anti-TMF monoclonal antibody, screening high

The method involves (a) administering to the human patient a blocking anti-CD22 monoclonal antibody binding to the first two Ig-like domains, or to an epitope within the first two Ig-like domains of native human CD22 (hCD22) (ABR82771) and (b) monitoring the response of the mailgnancy to the treatment. The method is useful for treating a human patient diagnosed with a B-cell malignancy comprising Hodgkin's lymphoma, Burkitt's lymphoma, multiple myeloma, chronic lymphocytic leukemia in hairy chamino acid sequence for heavy chain Wh-D-Jh junction for anti-CD22 antibody from hybridoma HB22-33
affinity F6 mAb using an indirect enzyme linked immunosorbent assay (ELISA). By cloning the monoclonal antibody light chain and heavy chain variable region (VL and VH respectively) genes, the monoclonal antibody light chain and heavy chain variable region gene sequence and amino acid sequence can be obtained, and the unicity of the gene sequence and protein sequence can be confirmed. This sequence represents the amino
                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                   63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD22; B-cell malignancy; anti-CD22 antibody; cytostatic; human; HB22-33.

The method involves administering to the patient an amount of a blocking anti-CD22 monoclonal antibody and monitoring the response of the autoimmune disease to the treatment. The method is useful in treating autoimmune disease (e.g. glomerulonephritis, systemic lupus erythematosus, rheumatoid arthritis, psoriasis, ulcerative colitis, Hashimoto's thyroiditis, autoimmune haemolytic anemias, diabetes or allergies) or B-cell malignancies (e.g. lymphomas or leukemias). The present sequence represents the amino acid sequence for heavy chain Vh-D-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating an autoimmune disease or a B-cell malignancy in a human patient comprises administering an amount of an anti-CD22 monoclonal antibody to the patient and monitoring the response of the disease to the treatment.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine chinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or receptor (EGFR) and/or with chyperactivity of signal transduction pathways mediated by interaction of hyperactivity of signal transduction pathways mediated by interaction of transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a novel isolated anti-insulin-like growth factor

I receptor (IGF-IR) antibody (I) or its functional fragment, being
capable of binding to human IGF-IR and, if necessary, capable of
specifically inhibiting tyrosine kinase activity of the receptor,
comprising a light or heavy chain having at least one complementary
comprising a light or heavy chain having at least one complementary
comprising a light or heavy chain having at least one complementary
comprising a light or heavy chain having at least one complementary
comprising a light or heavy chain having at least one complementary
containing reggion (CDR) consisting of one of two fully defined 16 amino
activation of a medicament intended for the prevention or treatment
containing reggion (CDR) and/or EGRF, and/or connected with a
hyperactivation of the IGF-IR and/or of EGRF, where
the administration of the medicament does not induce or oily slightly
induces secondary effects connected with inhibition of the insulin
containing region of the medicament does not induce or oily slightly
contactor, The antibody is useful for preparation of a medicament intended
conhibit the transformation of normal cells into cells with tumoral
conhibit the transformation of normal edpendent cells with the growth
cueful for preparation of a medicament intended to inhibit the growth
and/or the proliferation of tumor cells, preferably IGF-dependent,
cueful for preparation of a medicament intended to inhibit the growth
                                                                                                                                                                                                                       neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder; heavy chain variable region.

             HERZ/neu-dependent cells. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer of soleosarcoma, lung cancer, breast cancer, endometrial cancer or colon cancer. (I) is useful in the preparation of a medicament intended for the prevention or for the treatment of psoriasis. (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to cells expressing or overexpressing the IGF-IR and/or EGFR receptor is useful for in vitro diagnosis of illnesses induced by an overexpression or an underexpression of the IGF-IR and/or EGFR receptor at any in the suspected, which involves contacting the biological sample with (I), which is optionally labeled. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                                                                                                                                                                                                                                                                                                                                                        61

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1 R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or prostate, lung, breast, endometrium and colon, also osteosarcoma, and prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
